S1 Top500 vs. Top8000 Reference Contours

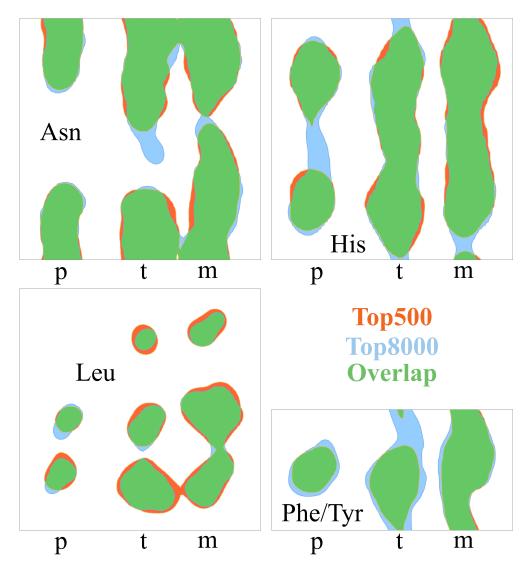

Figure S1: Areas in orange (from Top500 data) and in blue (from Top8000) fill the allowed regions for AsN, His, Leu, and Phe/Tyr. Phe and Tyr were done together as no significant difference was detected between their distributions. The extensive areas in green are where the two systems both declare allowed conformations.

 $\textbf{Table S2:} \ \ \text{Showing differences between outlier counts in the unfiltered dataset using the Top 500 and Top 8000 reference contours.}$

S4 Top8000 Filtered Dataset: Rotamer Frequency

The following is a table describing counts of each of the 213 rotamers identified in the Top8000 filtered dataset. n is the count of each rotamer, % is the percent of the rotamer that occurs in the given residue type (e.g. 17.7% of CYS are \mathbf{p}). Also noted is the rarity of each rotamer, defined at two levels – a singe and double checkmark. The rarity metric is normalized by both the number of residues and the number of rotamer types in a given residue type. If the empirical count for a rotamer is < 8% or < 1% of the expected rotamer count then the rarity is marked with a single or double checkmark, respectively. The expected rotamer count is the number of residues in a rotamer bin if all residues were distributed equally to all rotamer bins for a given residue type. e.g. if SER had 3000 residues in the dataset then the expected count for each of the three rotamers would be 1000. Further, if one of these rotamers had an empirical count < 80 or < 10, the rarity would be marked with a single or double checkmark respectively.

Table S3: Rotamer names, number of examples in the filtered data set, and frequency in its residue type.

S5 χ and Covalent Bond Angle Central Values

The following tables report the central χ and covalent bond angles for each rotamer identified in the Top8000. The central χ values are calculated by taking the center-of-mass (COM) of the smoothed contours in the given rotamer bin as described in Section 2.4. The mean for the covalent bond angles is a simple mean.
