Explanation of Material on GitHub

The rotamer data generated in this work are freely available via GitHub. To download the rotamer database, install git if necessary (instructions below) and then in a terminal run the command:

```
git clone --depth=1 https://github.com/rlabduke/reference_data.git
```

This will download the Richardson Lab reference data repository into a new subdirectory called reference_data. It contains the Top8000-generated rotamer data in reference_data/Top8000. The database requires a few hundred megabytes of disk space at the time of publication.

If you are experienced with SVN, you can instead use the command::

```
svn export https://github.com/rlabduke/reference_data.git/trunk/ reference_data
```

You can also browse the data online at https://github.com/rlabduke/reference_data/tree/master/Top8000. Most of the data files are too large to interact with in a browser. GitHub has a raw option to view text files directly in your browser available from each individual file's page after navigating to it in your browser, or via URLs of the form https://raw.githubusercontent.com/rlabduke/reference_data/master/Top8000/Top8000-SFbest_hom50_pdb_chain_list.csv, where the URL path after master/ is identical to the file path in the repository proper.

Contents of the Top8000 database:

- Top8000_best_hom##_pdb_chain_list.csv: a list of high data quality PDB chains at varying homology levels
- Top8000_SFbest_hom##_pdb_chain_list.csv: a list of high data quality PDB chains at varying homology levels that also have structure factor data deposited
- Top8000_rotamer_pdb_chain_count.csv: a list of exactly which structures were used to generate the rotamer data used here
- Top8000_rotamer_residues.csv: the rotamer assignment of each residue in the filtered dataset
- Top8000_rotamer_central_values

This directory contains, for each of the 18 canonical, rotameric amino acids, a table listing rotamer frequency data and the means and standard deviations of each rotamer's bond-torsion and covalent-bond angles.

• Top8000_rotamer_kinemages

This directory contains kinemage files plotting the rotamer distributions in various chi angle spaces (including both the data points and the contours), for visualization of the distributions.

• Top8000_rotamer_pct_contour_grids

This directory contains contour/rotamericity grids i χ space for each of the canonical, rotameric amino acids. Each file's header describes how to interpret it. Broadly, each file is a list of points that collectively grid out all of chi space (in however many dimensions/ χ s that sidechain has), plotting rotamericity at each grid point. Contours drawn through grid points of given values define regions of χ space above a the given rotamericity value. Grid areas with rotamericity below 0.3% (inclusive) represent outlier regions, regions above 2.0% (inclusive) define favored rotamers, and regions in between are defined as allowed.

Installing git

Git is a powerful tool for version control, used by the Richardson Lab and many others to distribute and control their source code. GitHub is a popular website used to manage git-controlled projects. We are using GitHub and git to distribute these rotamer database in the same way we distribute our other source code.

Installation instructions for git are available at http://git-scm.com/. GitHub is simply a website (github.com).

Top500 vs. Top8000 Reference Contours

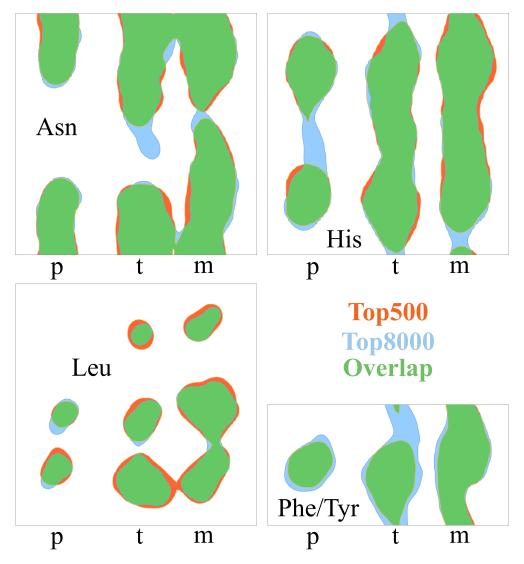

Figure S1: Areas in orange (from Top500 data) and in blue (from Top8000) fill the allowed regions for AsN, His, Leu, and Phe/Tyr. Phe and Tyr were done together as no significant difference was detected between their distributions. The extensive areas in green are where the two systems both declare allowed conformations. See Figure 2 for Asp, Trp, and Ile

 $\textbf{Table S2:} \ \ \text{Showing differences between outlier counts in the unfiltered dataset using the Top 500 and Top 8000 reference contours.}$

Top8000 Filtered Dataset: Rotamer Frequency

The following is a table describing counts of each of the 213 rotamers identified in the Top8000 filtered dataset. n is the count of each rotamer, % is the percent of the rotamer that occurs in the given residue type (e.g. 17.7% of CYS are \mathbf{p}). Also noted is the *rarity* of each rotamer, marked with a checkmark. The rarity metric is normalized by both the number of residues and the number of rotamer types in a given residue type. If the empirical count for a rotamer is < 8% of the *expected rotamer count* then the rarity is marked with a checkmark.

The expected rotamer count is the number of residues in a rotamer bin if all residues were distributed equally to all rotamer bins for a given residue type. e.g. as shown below, LEU has 115,053 examples in the filtered dataset and 8 rotamers. Thus LEU has an expected rotamer count of $115,053/8 \approx 14,382$. LEU **pp** has 521 examples which is 3.7% of the expected rotamer count thus gets a checkmark.

These numbers, along with central angle values, are available in CSV format on GitHub under Top8000/Top8000_rotamer_central_values at http://github.com/rlabduke/reference_data.

 ${\bf Table~S3:}~{\bf Rotamer~names,~number~of~examples~in~the~filtered~data~set,~and~frequency~in~its~residue~type.$

χ and Covalent Bond Angle Central Values

The following tables report the central χ and covalent bond angles for each rotamer identified in the Top8000. The central χ values are calculated by taking the center-of-mass (COM) of the smoothed contours in the given rotamer bin as described in Section 2.4. The mean for the covalent bond angles is a simple mean. These numbers, along with rotamer occurrence frequencies, are available in CSV format on GitHub under Top8000/Top8000_rotamer_central_values at http://github.com/rlabduke/reference_data.

Table S4: SER Central Values
